# Hispatec shows Berries Mexican producers its Agricultural Software

Hispatec had its own stand in the ninth edition of the International Aneberries Congress, which focused on internationalization, social responsibility and sustainability. In addition, the agricultural sample included speakers from the United States, Cuba, Brazil, the Netherlands, Canada, Israel and Chile with an expected attendance of more than 1500 attendees.

**In 2018, 360 thousand tons of Mexican berries were exported to 35 countries for more than 2200 million dollars**, which makes them the third most exported agri-food product in Mexico, only behind beer and avocado. The technology company has received a large number of visits from Mexican berry producers who wanted to know more about its integral ERPagro agricultural management software and how it adds value to the production chains, being these more efficient.

Hispatec has numerous clients in this sector in Huelva, the main European producer and is now extending its capabilities to other Latin American producing countries. In addition, he has exposed the benefits of incorporating this system into the strategic and operational decisions of an agribusiness.

**The objective of an ERP (Enterprise Resource Planning) is to manage all the information that a company produces** in order to achieve greater management efficiency. ERPagro is the leading solution for companies in the agri-food sector in Spanish. Its field of action covers all the process and product links of a company.

From cultivation to final marketing to the consumer through supply management, accounting, traceability, quality control and much more. At the same time, far from being a closed “software”, the company's specialty is to be the technological partner of the agricultural companies, providing the solutions they need with ERPagro as a starting point and base of operations so that each client can have their own Solution that meets your needs in a specific and concrete way.
