Stone fruit: Integrated solutions without waste

Agrotecnología Group participates from 10 to 12 March at the Extraordinary Congress of Stone Fruit of the Region of Murcia, a meeting that aims to bring together representatives of all the links of the stone fruit sector and that the company will use to display multiple of their solutions, without waste and ecological for this sector: Actium, Politec and Lecitec. It

will be a presentation on March 10 from 10:15 am in Room Company.

In the case of Actium, it is a bio-stimulant that acts as a potent activator of fruit coloring, also contributing, to standardize and improve color and improve the caliber and turgidity of the fruit.

Politec is, meanwhile, an attractant that concentrates and increases the activity of pollinators at different times of flowering. Thus, Politec helps not only to improve pollination, but also the percentage of fruit set and thus the crop yields.

Finally, Lecitec is a compound that minimizes cracking of the fruit, but not only that. Lecitec helps improve the general appearance of the fruit, improving its firmness, color, brightness and, above all, helping to prolong its life and thus postharvest, also has a marked effect without providing crop protection fungicide residues.

Production of stone fruit in the region of Murcia exceeds 350,000 tons, of which 95% is exported annually. This sector also employs a total of 20,000 people in the collection, processing and distribution.
